Interest: IT Support, Cloud
Computing, Cybersecurity & AI

Internship/Project: Asset Tracker
Agentic AI

Hello!

Name: Mahamed Ali

Major: BS in Information Technology

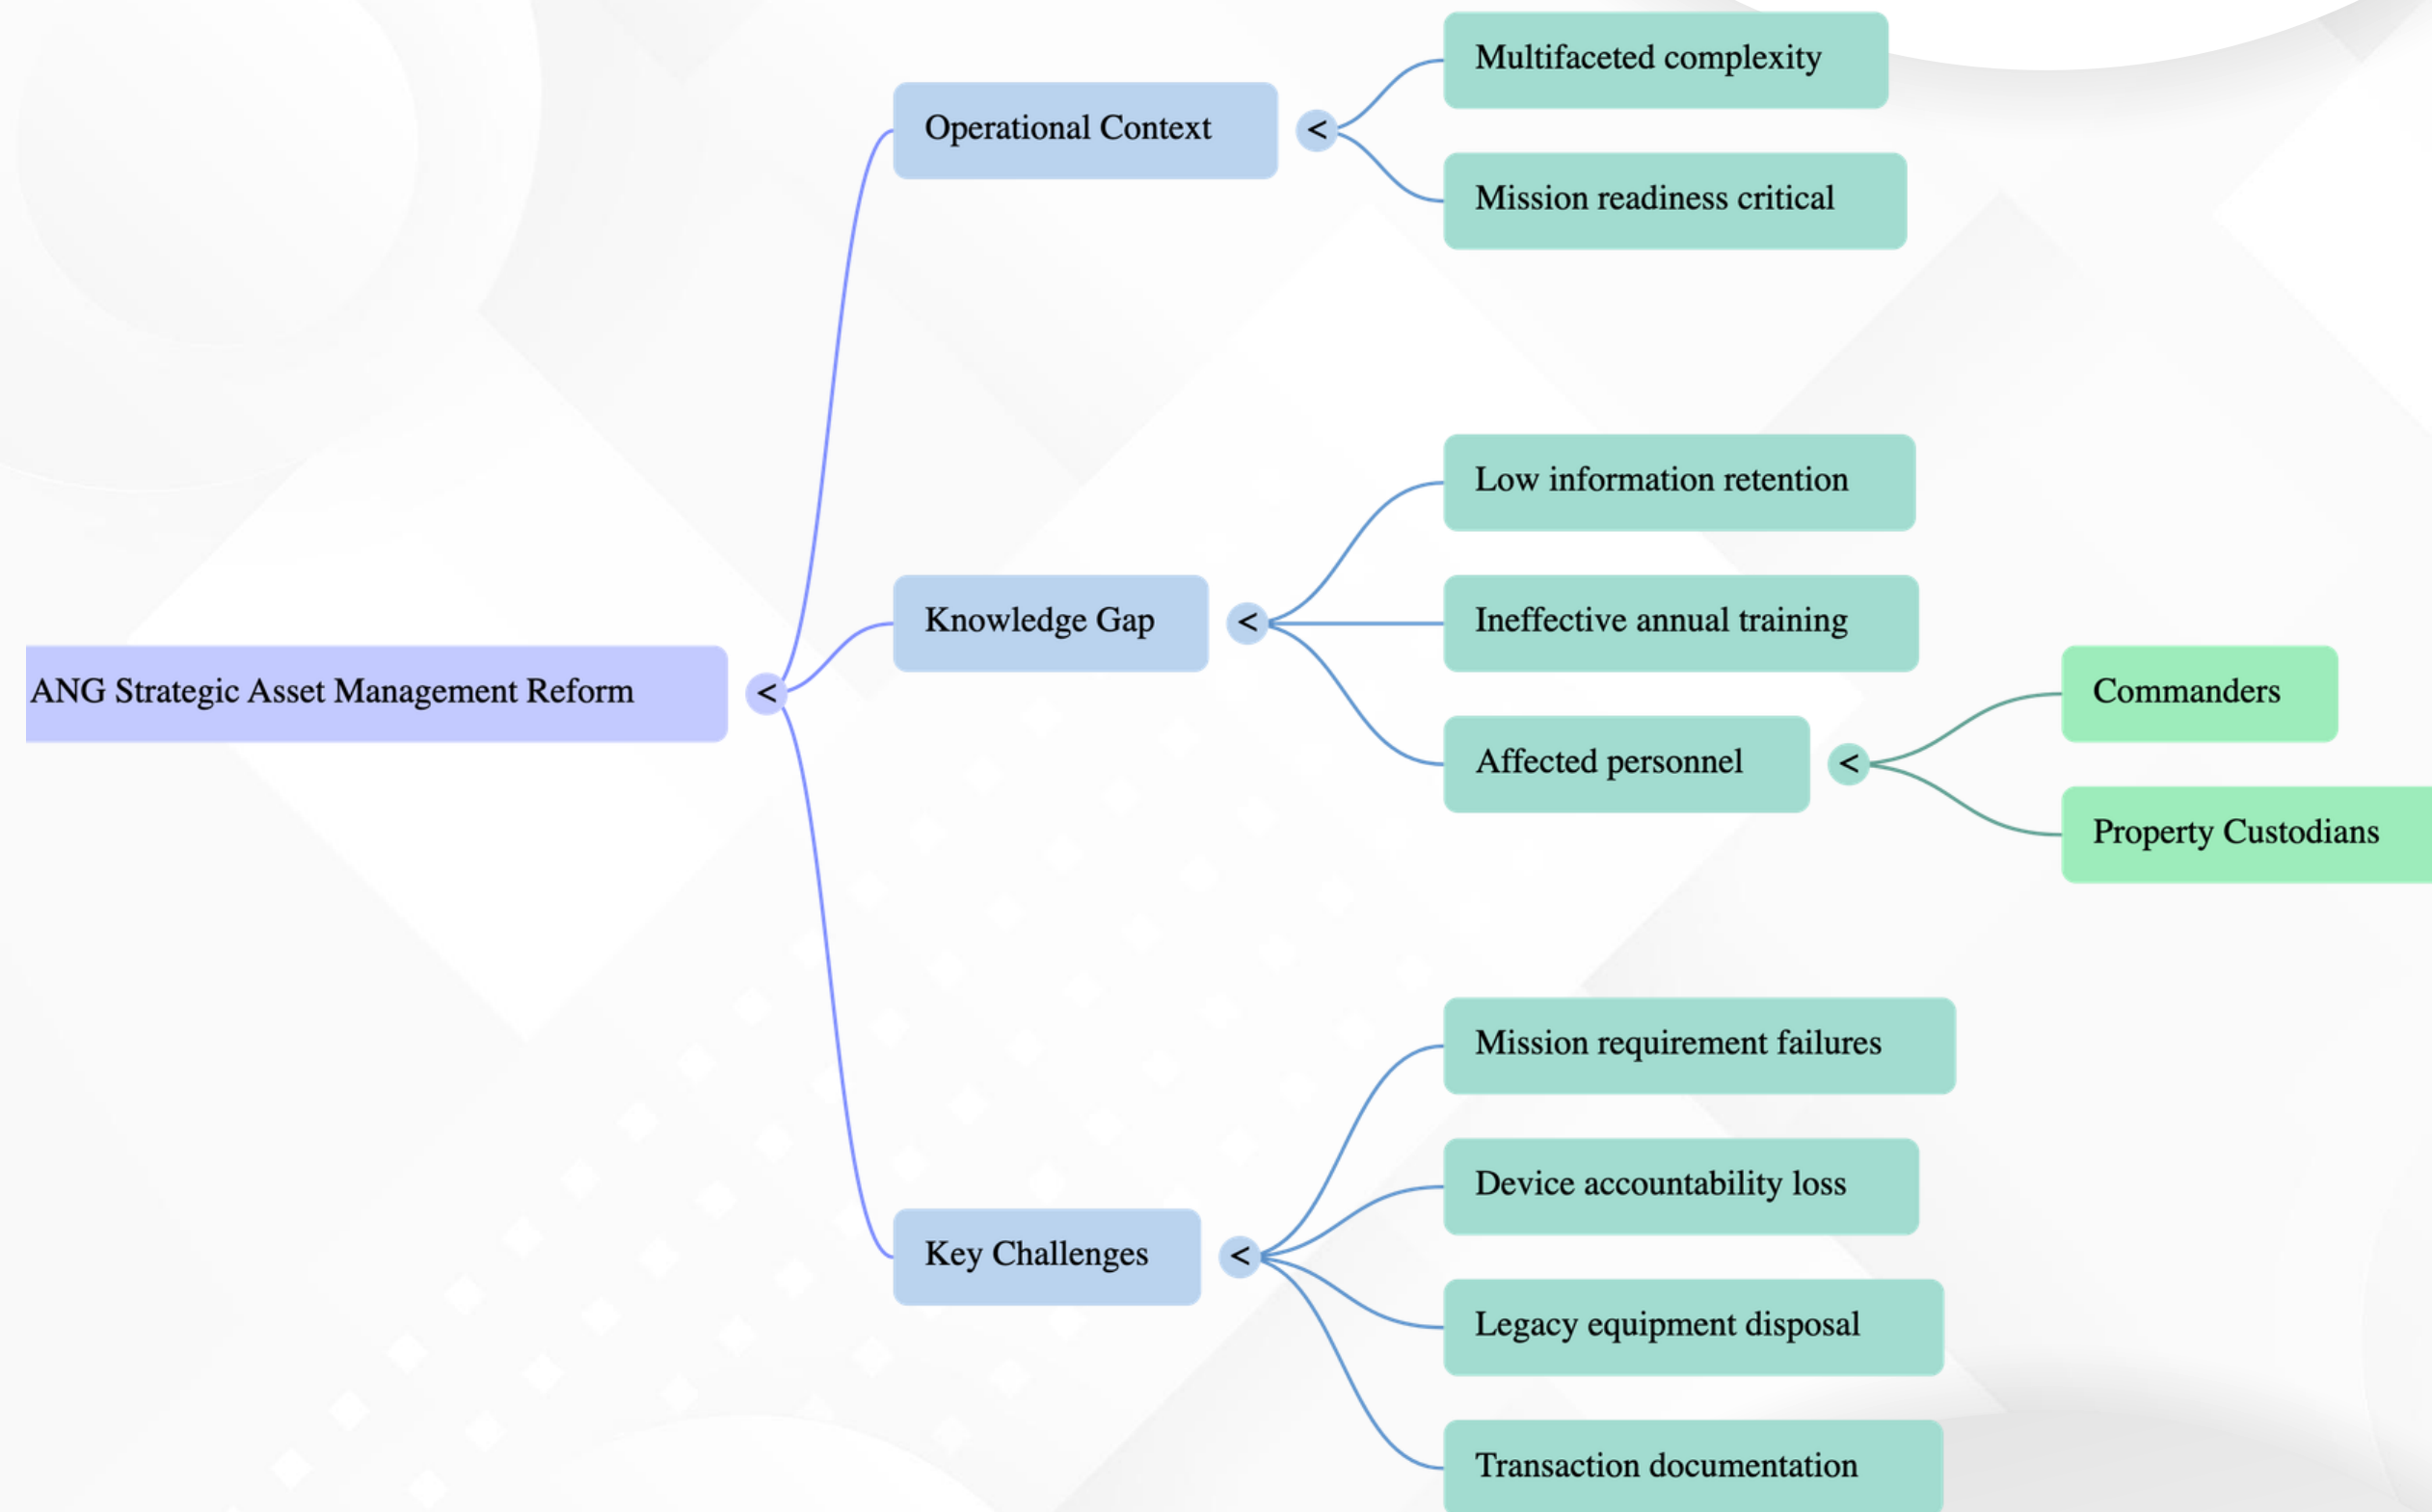

Interest: IT Support, Cloud
Computing, AI opportunitites

Internship/Project: Asset Tracker
Agentic AI

THE PROBLEM

ASSET MANAGEMENT KNOWLEDGE GAP

- Low information retention
- No centralized knowledge base
- Ineffective annual training
- Affected personnel

DAFMAN 17-1203

Overview

What is DAFMAN 17-1203?

- The Air Force's official rulebook for tracking all government-owned computers, devices, and software
- Covers everything from the moment equipment is purchased to when it's disposed of

Who does it apply to?

- All Air Force, Space Force, Air National Guard, and Air Force Reserve personnel — military and civilian

Why does it exist?

- To know what technology the Air Force owns, where it is, and what it's worth
- To avoid overspending, licensing violations, and cybersecurity blind spots

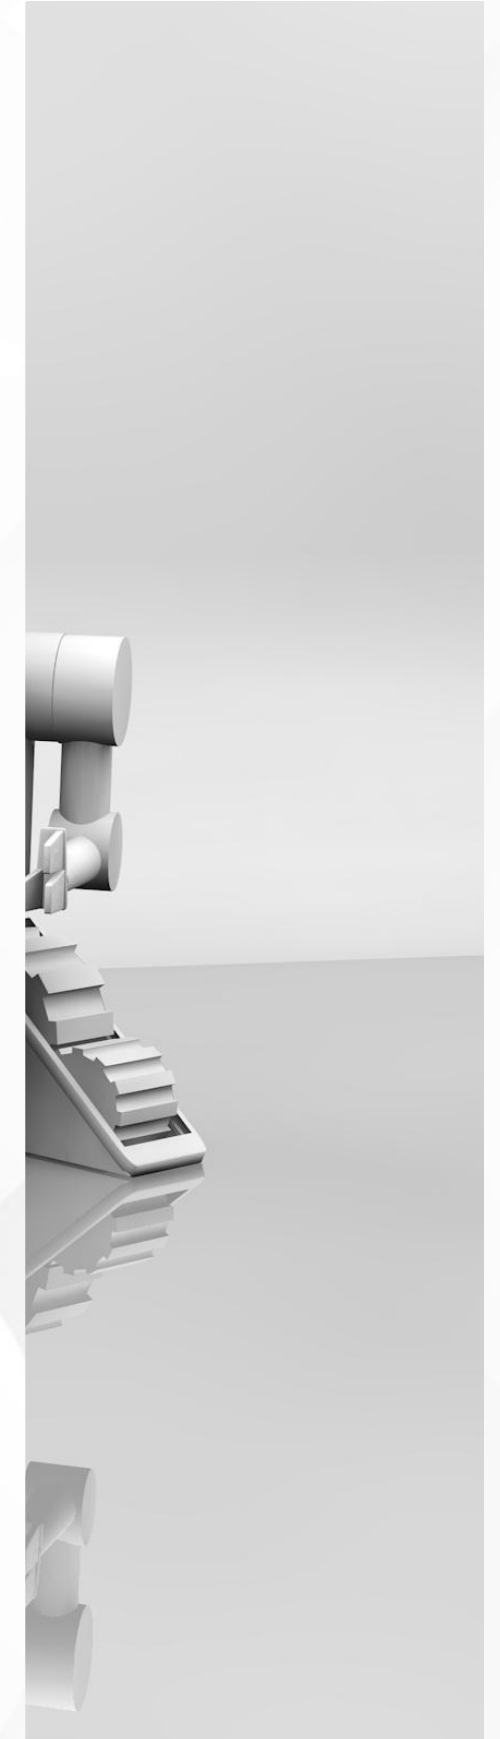

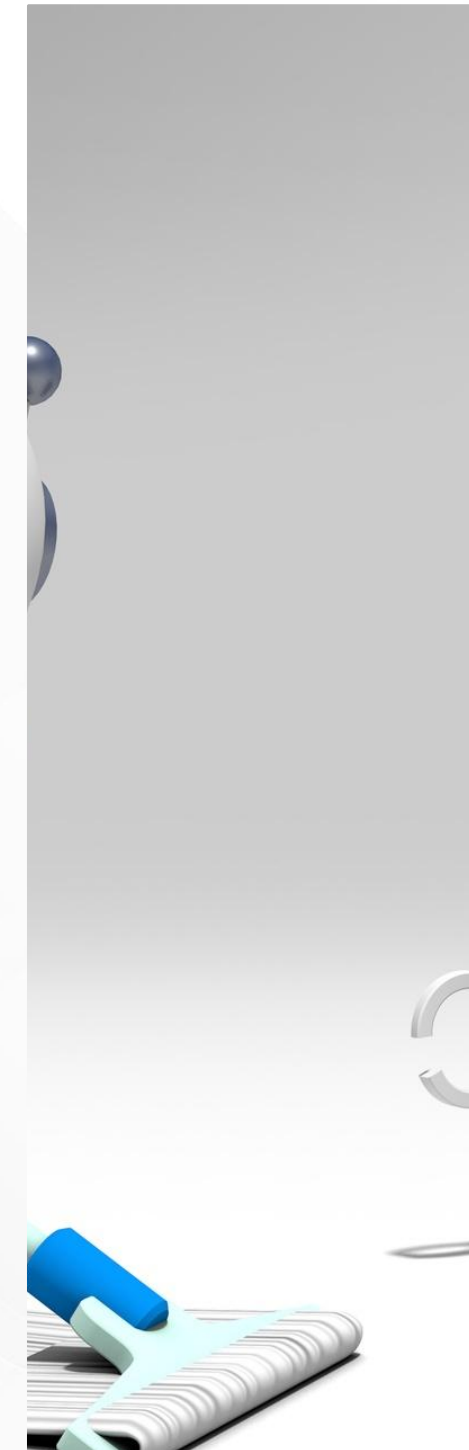

How is tracking done?

- Electronic/automated tracking preferred; manual counting is a last resort

DAFMAN 17-1203

Information Technology Asset Management

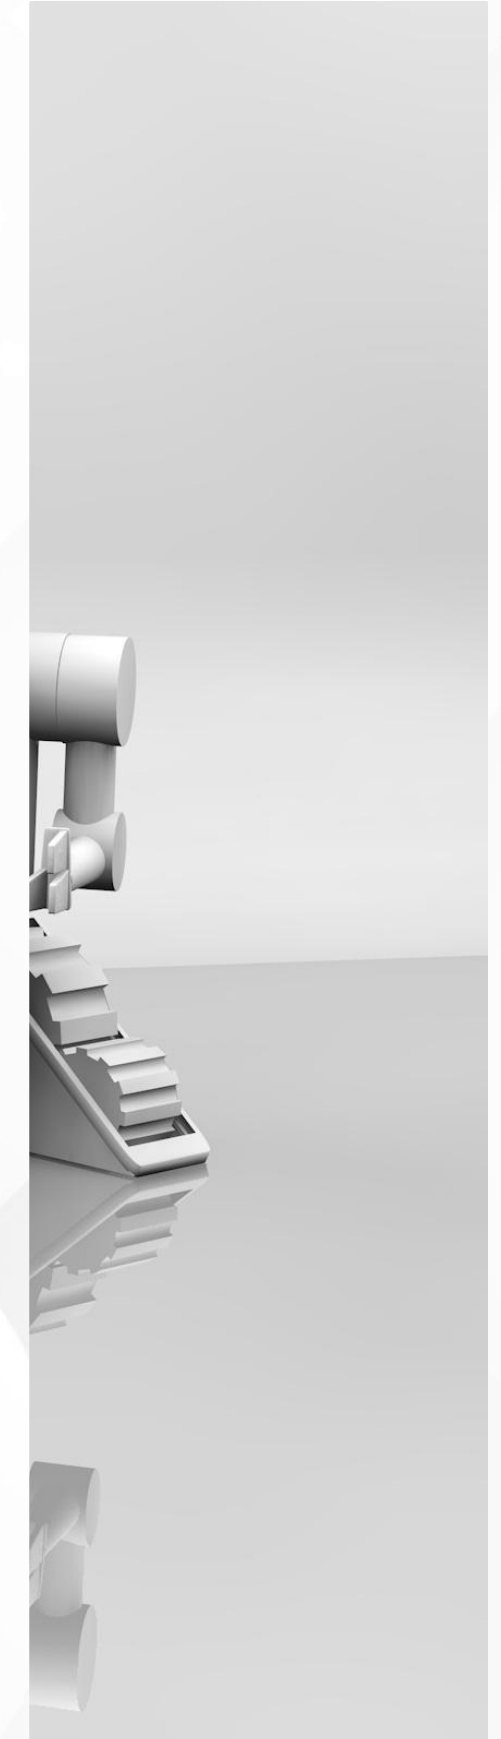

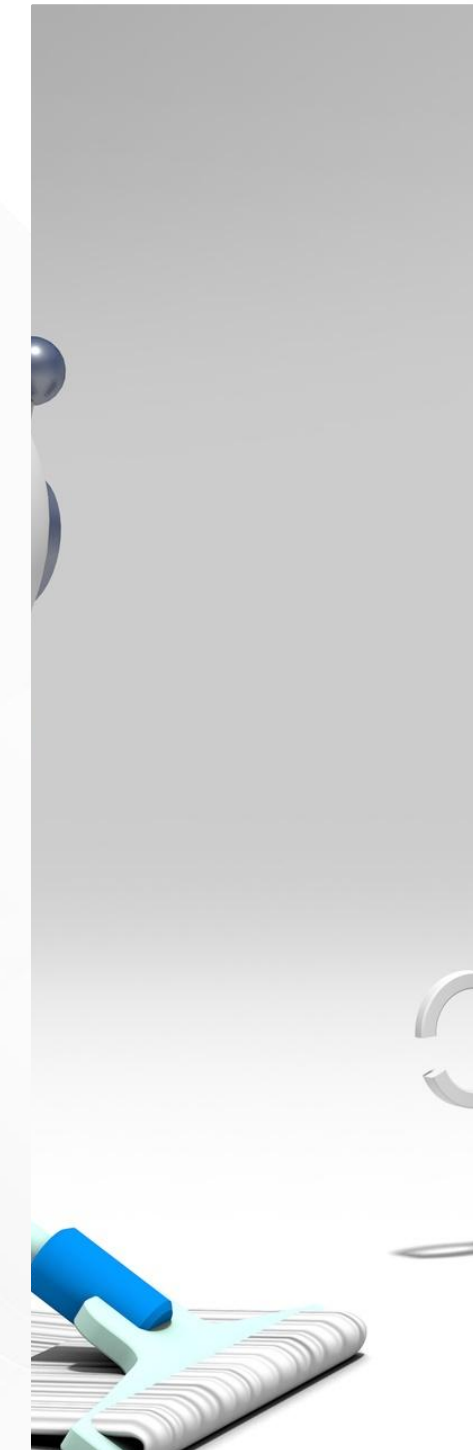

- Framework for managing all DAF IT assets
- Covers both hardware and software
- Goal: stay compliant, save money, and know what they have
- Automated tracking is preferred over manual counts
- Applies to all Air Force, Space Force, ANG, and Reserve personnel

DAFMAN 17-1203

Hardware Asset Management

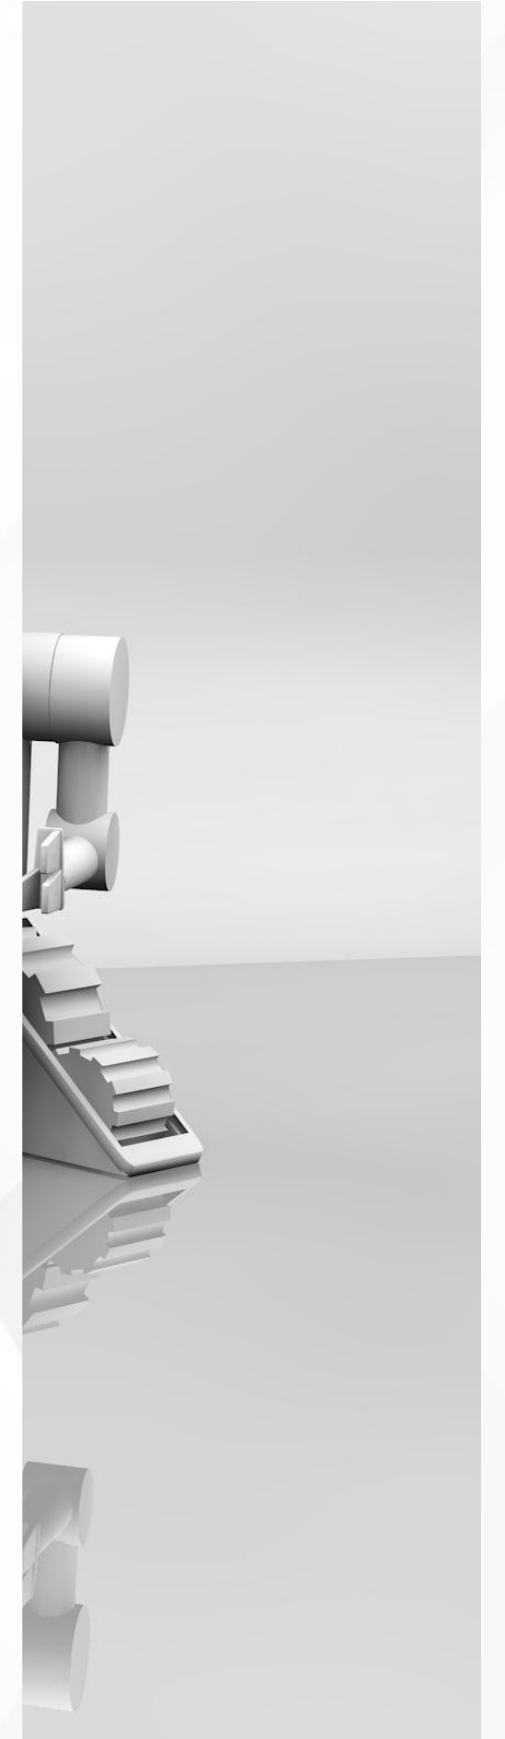

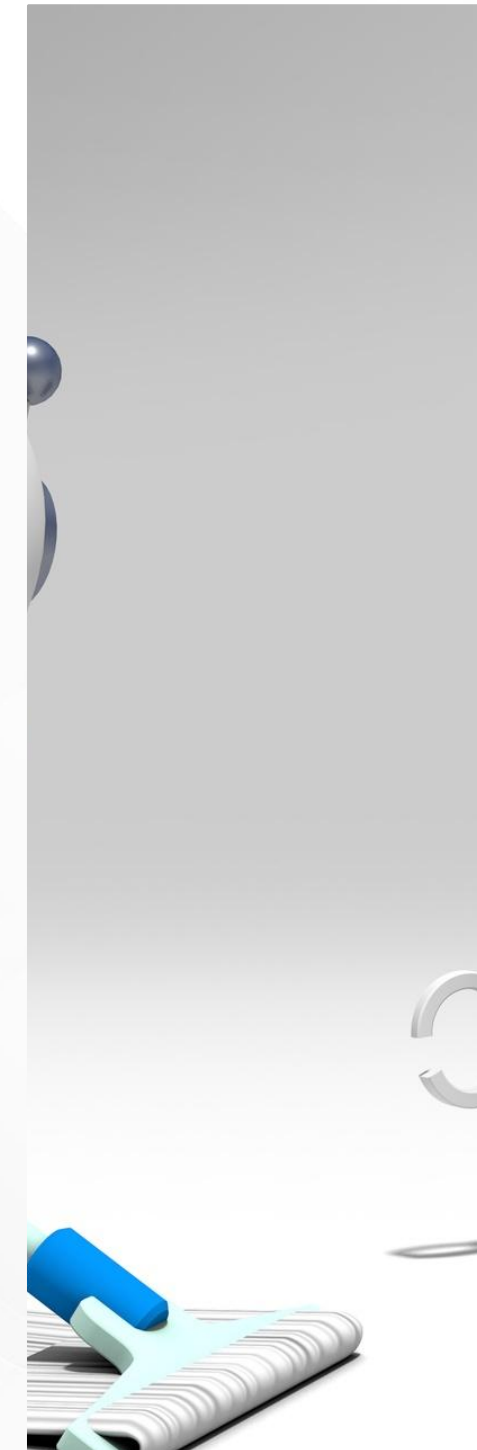

- Tracks physical IT assets — computers, servers, printers, phones
- Every asset has an owner and a record in the system
- Assets are tracked from purchase to disposal
- Refresh schedule: most devices replaced every 4–5 years
- Old equipment turned in through official disposal channels
- Hard drives must be wiped before any turn-in

DAFMAN 17-1203

Software Asset Management

- Tracks software licenses across the entire Air Force
- Two types: Capital (high cost, long-term) and Non-Capital (everything else)
- Must buy software through approved channels — no going rogue
- Annual inventory of all software is required
- Unused licenses must be returned or redistributed
- No software installed without proper approval

DAFMAN 17-1203

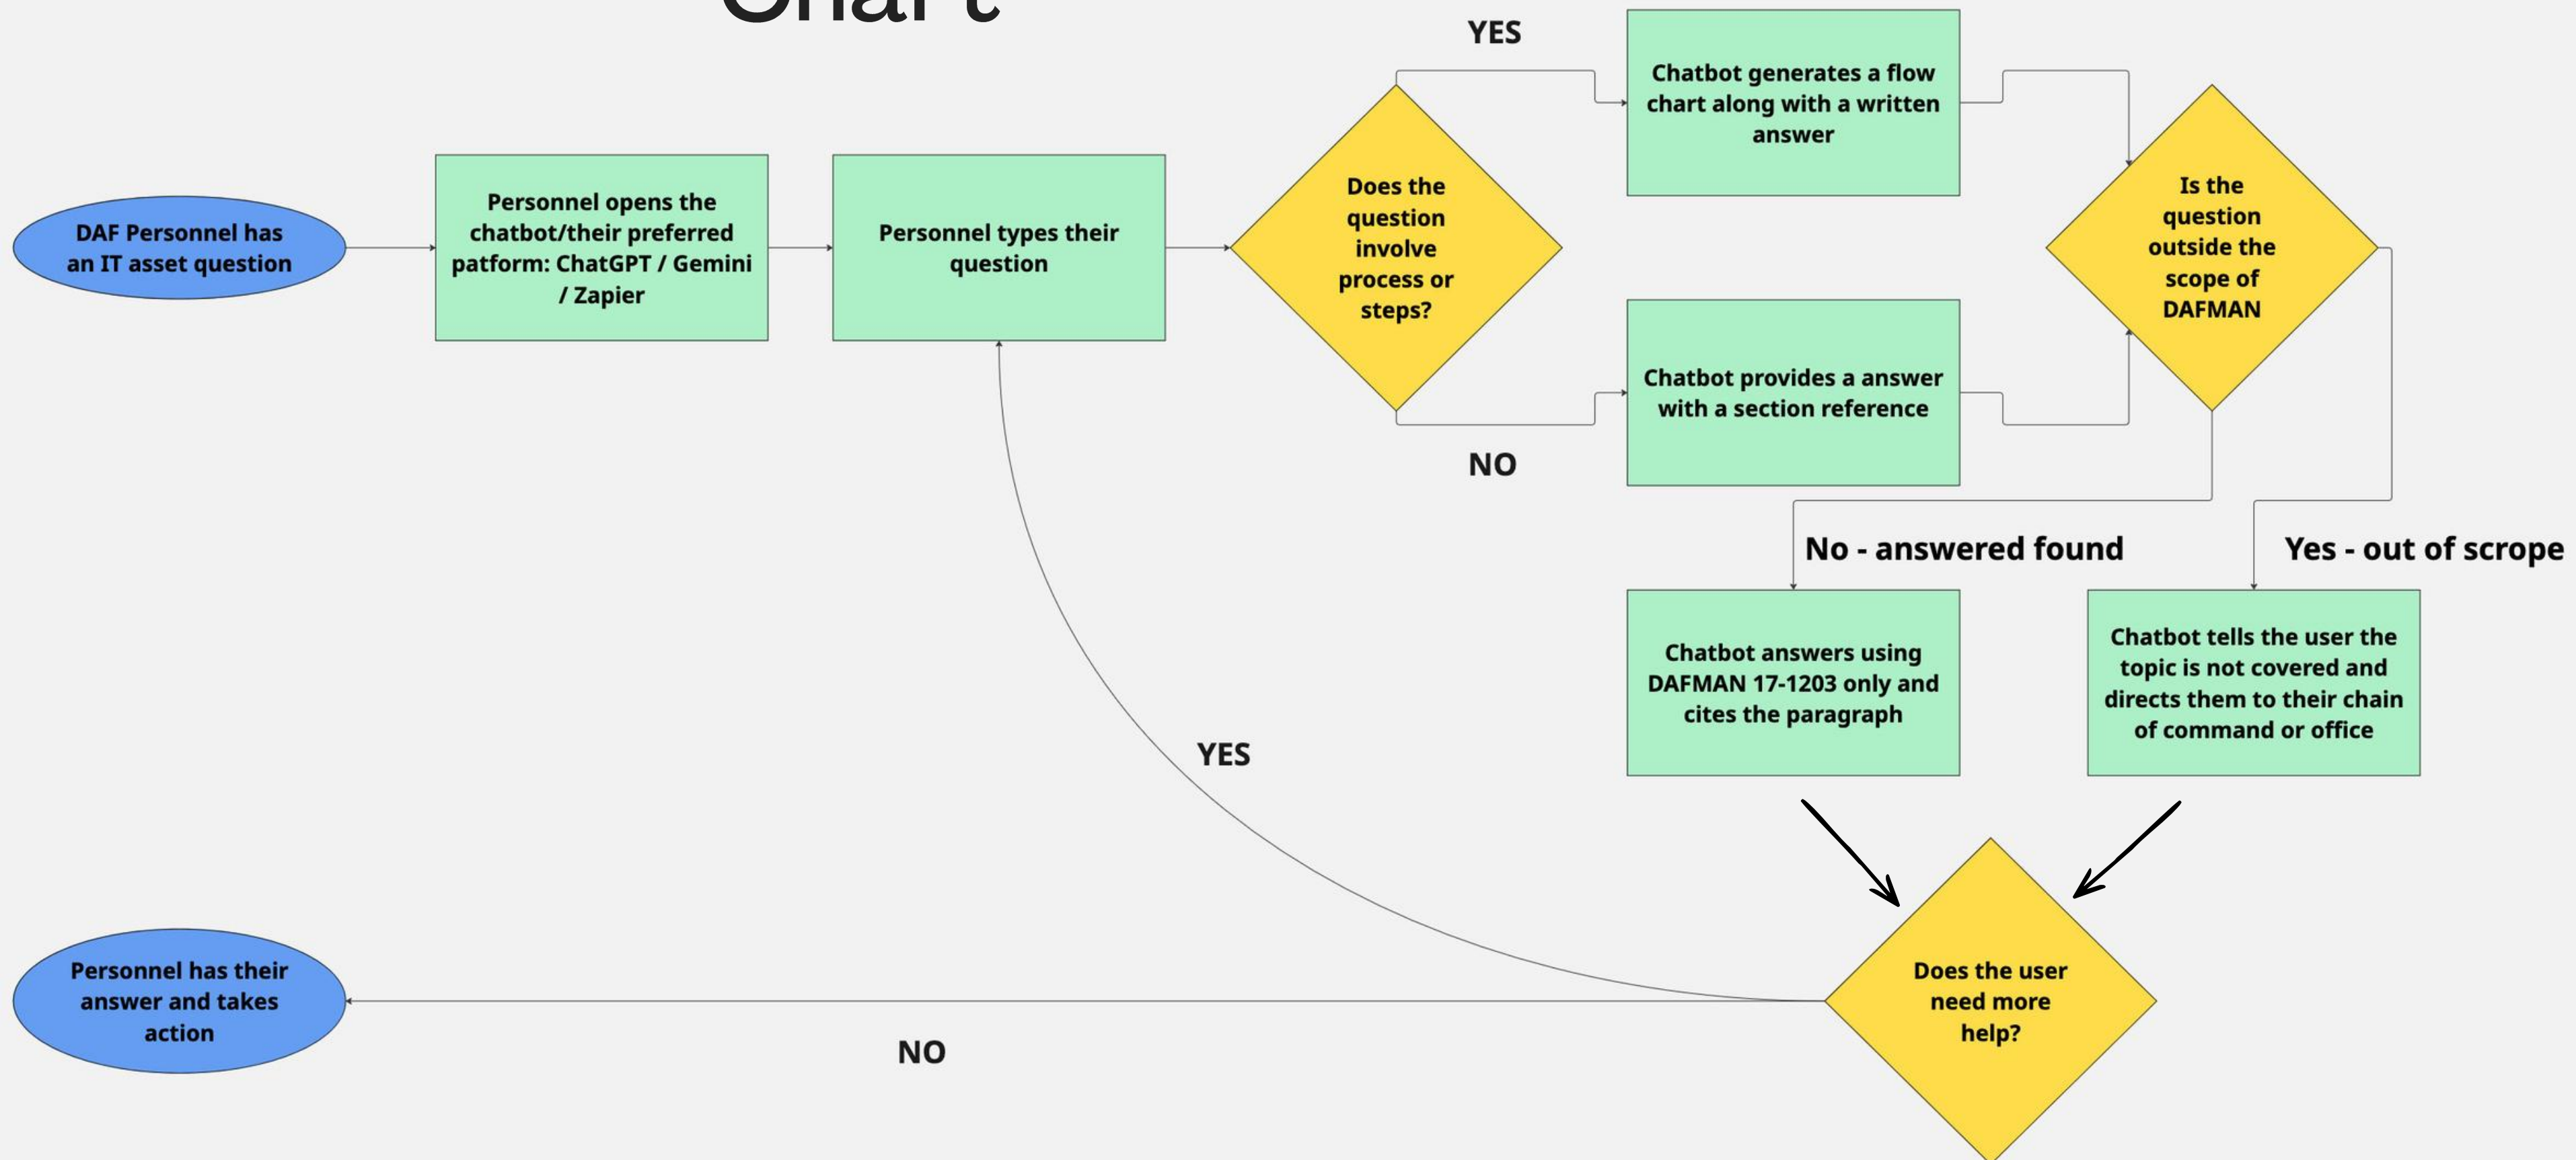

Key Takeaways

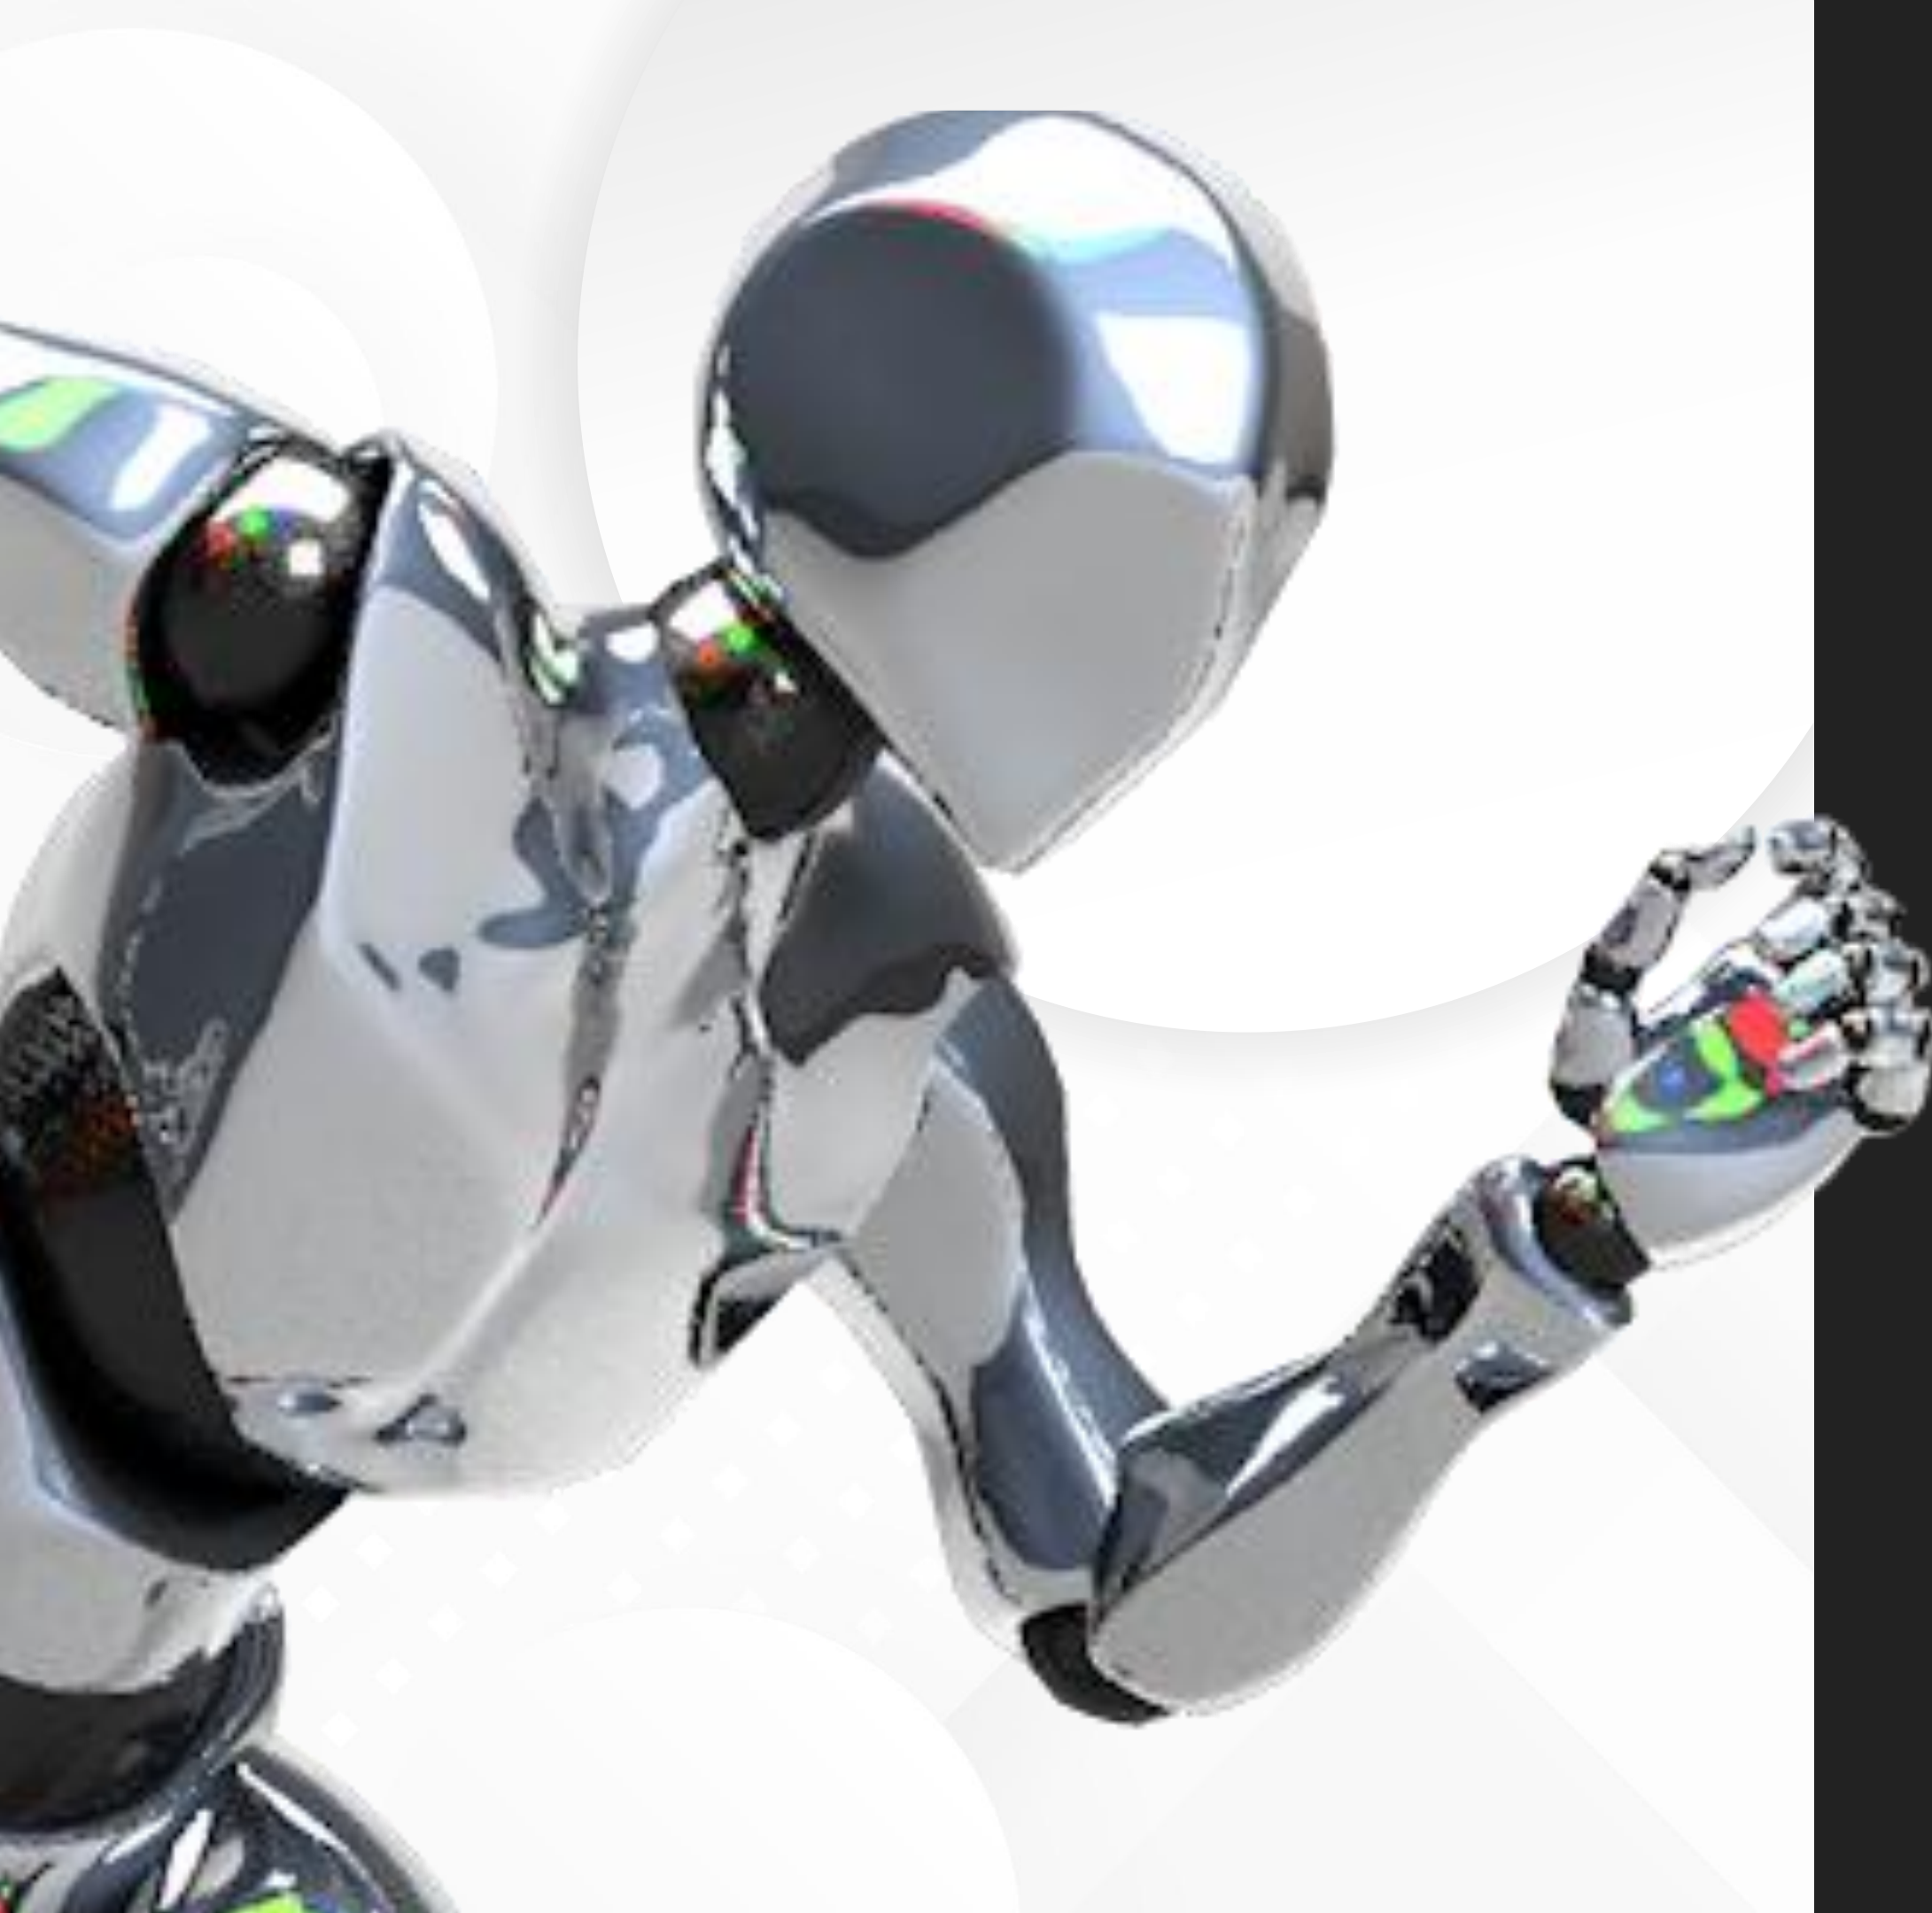

- Compliance is mandatory for all Air Force and Space Force personnel — no exceptions
- All government computers and devices must be logged in a tracking system from purchase to disposal
- Software must be properly licensed and inventoried — you can't just install or buy software without approval
- Everyone has a defined role, from senior leadership down to the person actually holding the equipment

Our Propose Solution

Three AI Prototypes	Agentic AI Guidance	Comparing the Chatbots
Built the same intelligent agent across ChatGPT (Custom GPT), Google, Gemini (Gems), and Zapier (Custom Chatbot)	Configured each agent with step-by-step instructions	Ease of Use: Gemini Gems > Zapier Custom Chatbot > Custom GPT
Compared ease of setup, controls, and user experience	Covered acquisition, disposition, transfers, inventories, and tool usage	Customization: Custom GPT > Zapier Custom Chatbot > Gemini Gems
Focused on Air National Guard use	Filled training and knowledge gaps	Integration: Zapier Custom Chatbot > Gemini Gems > Custom GPT

Use Case Flow Chart

Custom Chatbot

- ChatGPT: <https://chatgpt.com/g/g-6a0a4e06a4e481918e6282180b2e0e53-ang-asset-management>
- **Google Gemini:**

Which One is Better for the Air National Guard?

ChatGPT Custom Gpt	Google Gemini Gems	Zapier Custom Chatbot
Customization: Highly tailorable for military terminology, workflows, and asset tracking logic.	Customization: Focused on Google ecosystem; can be fine-tuned for asset databases but less flexible for niche military needs.	Customization: Low-code, rule-based; good for automating repetitive tasks
Integration: Connects with APIs through plugins or custom code, but may require developer support.	Integration: Strong with Google Workspace (Sheets, Docs) and BigQuery; limited to Google's supported tools.	Integration: Works with apps (Slack, email, databases) but lacks deep AI reasoning.
Use Case: Best for complex, conversational queries with deep context.	Use Case: Ideal for teams already using Google tools, needing quick data lookups or reports.	Use Case: Best for workflow automation (triggering alerts, updating spreadsheets) rather than complex decision-making.

Thank You for Listening!
